Check-ins

Two gates where the work stops for you, one notice and the delivery.

Check-in	What you see	What your answer does
CHECK-IN 1	The plan, the budget, numbered assumptions and the published figures to aim for	A gate: generation starts only after you approve it
CHECK-IN 2	An early side-by-side comparison at the waypoint agreed at CHECK-IN 1	A gate: the bulk of the compute waits for your go
Deviation check-in	A change of course, reported when it happens, with its reason	A notice: the run continues; you can object
Final check-in	The results: figures, numbers with their evidence, limitations and the panel verdict	You accept the results or ask to revisit a step

Nothing is generated before CHECK-IN 1 is approved. An approval covers only what it names; elapsed time is not approval.
