

Where the work runs

Three ways to run a calculation, chosen by the route at step 2.

	Native toolchain	Container fallback	Python only
Where	macOS, with the native toolchain installed	An x86 container under podman	macOS or Linux with Python 3.10 to 3.12
What	The full event chain, with native analysis ports and Rivet	SimpleAnalysis routines without a native port	Replay, likelihood-only runs and supplied-data studies
Time	About 30 to 50 minutes per point	About 9 hours per point, under emulation	Seconds to minutes

The native toolchain is the default. The container runs one point at a time. Long stages run under supervision; a resumed stage reuses its output only when its recorded inputs, code and runtime match.
