

Request you describe the physics question in plain language

Intake the request becomes a task contract; nothing runs yet

Environment check the native toolchain, or set it up

Inputs and route find published inputs; choose the analysis route

CHECK-IN 1 you approve the plan, budget and assumptions

Generate events, checked before the shower

Analyze detector response and selection

Visualize compare with published distributions

Acquire data the published likelihood or counts

Exclude the 95% CLs exclusion limit

Compute one model point

CHECK-IN 2

once, at the waypoint agreed at CHECK-IN 1: you review an early, cheap comparison before the bulk of the compute

Scan repeat steps 3 to 7 over the grid; skipped for a single point

Verify trace every number; independent physics review

Final check-in you accept the results or ask to revisit a step

Scan, verify and deliver

Every step is recorded in the run directory. A change of course is reported at once in a deviation check-in.
