

Leading-parton-cut control: rate decomposition

Four-state slepton–bino 150/140 GeV · $\sqrt{s}$ = 13 TeV · nominal 60k vs lower-cut 20k original events

Thick: conditional fixed-N 1 SE. Thin: conditional + independent integration 1 SE. x: precision unresolved.

Original histogram MC errors and the unchanged $\leq 5\%$ floor are separate in the numeric table and report.

Cutoff-control approximation (leading parton 50 to 20 GeV). Unknown integration-selection covariance; no calibrated correction.
